

CAROL LANGLEY (OH)

Expanding Sea, wax, paper, pastel, on panel, 11 x 14 inches

The evidence that current global warming is occurring roughly ten times faster than past warming events is compelling. I'm fascinated—and horrified—by NASA observations of melting ice sheets and glaciers and the predictions that rising sea levels will continue to erode coasts and cause more frequent coastal flooding in the future. With this piece, I sought to depict one of the most detrimental long-term effects of the climate crisis: the rising sea; the expansion of seawater as it warms.
